

Principal component capture-recapture analysis of Snow petrel data

Olivier Gimenez

24 décembre 2016

Introduction

We illustrate the principal component capture-recapture (P2CR) method for covariates selection in capture-recapture models using data on survival of Snow petrels in Pointe Géologie Archipelago, Terre Adélie, Antarctica. In total, the dataset consists of 604 female histories from 1973 to 2002. The objective is to investigate the effect of climatic conditions on adult survival.

Explore climatic covariates

First we explore the covariates sea ice extent in summer (SIE.Su), in autumn and winter (SIE.Au and SIE.Wi), in spring (SIE.Sp), annual southern oscillation index (SOI), air temperature in summer (T.Su), in autumn and winter (T.Au and T.Wi) and in spring (T.Sp).

Let us have a look to the correlations between these covariates:

```
cov <- read.table('cov-petrel.txt',header=T)
head(cov)
```

```
##      SIE.Su SIE.Au SIE.Wi SIE.Sp  SOI      T.Su      T.au      T.wi

## T.sp      0.01 -0.12  0.04 -0.18  0.14 -0.05  0.06  0.00  1.00
```

Visually, with a heatmap:

```
library(ggplot2)
library(reshape2)
qplot(x=Var1, y=Var2, data=melt(cor(cov)), fill=value, geom="tile")
```

What are the significant correlations?

```
library(psych)

```

```
## T.au-T.sp      -0.32  0.06  0.41  0.77  
## T.wi-T.sp      -0.37  0.00  0.37  0.99
```

Seems like sea ice extent in autumn and winter are positively correlated, while sea ice extent in autumn and temperature in autumn are negatively correlated.

PCA on covariates

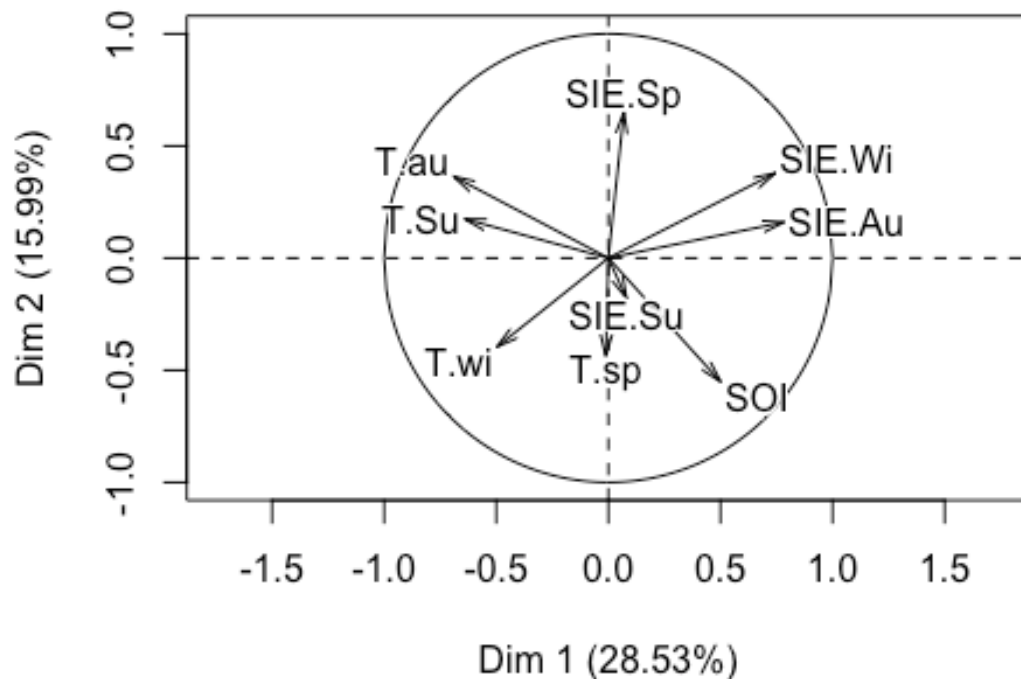

Let's perform a PCA on this set of covariates:

```
library(FactoMineR)  
res.pca = PCA(cov,scale.unit=T,graph=T,ncp=9)
```

Individuals factor map (PCA)

Variables factor map (PCA)

Find the covariates associated to each principal component:

```
dimdesc(res.pca, axes = 1:9)

Model fitting

We're gonna fit various capture-recapture models to the petrel data. We use [RMark](#) because everything can be done in R, and it's cool for reproducible research. But other pieces of software could be used too, like e.g. E-SURGE.

First, let's read in the data:

```
library(RMark)

## This is RMark 2.2.0

petrel=convert.inp("females_petrel")
#petrel$ch
```

Before fitting capture-recapture models to the data, we check whether the standard Cormack-Jolly-Seber model is fitting the data well. We use the R package R2ucare.

```
library(R2ucare)
petrel.ch <- unlist(strsplit(petrel$ch, ""))
nocc <- nchar(petrel$ch[1])
petrel.ch <- matrix(as.numeric(petrel.ch), ncol = nocc, byrow = TRUE)
freq = petrel$freq
global = overall_CJS(petrel.ch, freq)
global

##                                chi2 degree_of_freedom p_value

## 25     26      1 1.319 0.251 Chi-square
## 26     27      1 0.212 0.645 Chi-square
```

It sounds like there is a strong trap-dependence effect. Let's deal with it and create an individual time-varying covariate for trap-dependence (see appendix C of the Gentle introduction to Mark):

```
petrel.ch <- unlist(strsplit(petrel$ch, ""))
nocc <- nchar(petrel$ch[1])
petrel.td <- matrix(as.numeric(petrel.ch), ncol = nocc, byrow = TRUE)
petrel.td <- petrel.td[, 1:(nocc - 1)]
petrel.td <- as.data.frame(petrel.td)
begin.time <- 1974
names(petrel.td) <- paste('td', (begin.time + 1):(begin.time + nocc - 1), sep = "")
#head(petrel.td) # dim 430 x 29
dim(petrel.td)

## [1] 430 29

petrel <- cbind(petrel, petrel.td)
#head(petrel)
```

Now process the data:

```
petrel.processed=process.data(petrel, model="CJS", begin.time=1974)
```

Create the default design matrix:

```
design.p=list(time.varying=c('td')) #td
design.parameters <- list(p=design.p)
petrel.ddl <- make.design.data(petrel.processed,parameters=design.parameters)
```

Standardize the covariates:

```
# standardize
moy = apply(cov,2,mean)
prec = apply(cov,2,sd)
moymat = matrix(rep(moy,nrow(cov)),ncol=ncol(cov),byrow=T)
precmat = matrix(rep(prec,nrow(cov)),ncol=ncol(cov),byrow=T)
covstar = (cov - moymat)/precmat
#apply(covstar,2,mean)
#apply(covstar,2,sd)
cov = covstar
```

Add raw covariates to the design matrix:

```
petrel.ddl$Phi$x1=0
petrel.ddl$Phi$x2=0
petrel.ddl$Phi$x3=0
petrel.ddl$Phi$x4=0
petrel.ddl$Phi$x5=0
petrel.ddl$Phi$x6=0
petrel.ddl$Phi$x7=0
petrel.ddl$Phi$x8=0
petrel.ddl$Phi$x9=0
ind=1
for (i in 1974:2002){
  petrel.ddl$Phi$x1[petrel.ddl$Phi$time==i]=cov[ind,1]
  petrel.ddl$Phi$x2[petrel.ddl$Phi$time==i]=cov[ind,2]
  petrel.ddl$Phi$x3[petrel.ddl$Phi$time==i]=cov[ind,3]
  petrel.ddl$Phi$x4[petrel.ddl$Phi$time==i]=cov[ind,4]
  petrel.ddl$Phi$x5[petrel.ddl$Phi$time==i]=cov[ind,5]
  petrel.ddl$Phi$x6[petrel.ddl$Phi$time==i]=cov[ind,6]
  petrel.ddl$Phi$x7[petrel.ddl$Phi$time==i]=cov[ind,7]
  petrel.ddl$Phi$x8[petrel.ddl$Phi$time==i]=cov[ind,8]
  petrel.ddl$Phi$x9[petrel.ddl$Phi$time==i]=cov[ind,9]
  ind=ind+1
}
```

Specify the effects on survival and detection probabilities:

```
# for survival probabilities
Phidot=list(formula=~1) # constant
Phitime=list(formula=~time) # time
PhiCov=list(formula=~x1+x2+x3+x4+x5+x6+x7+x8+x9) # all covariates
# Define range of models for detection probabilities
pdot=list(formula=~td) # constant, with trap-dependence
ptime=list(formula=~time+td) # additive effect of time and trap-dependence
(no interaction because of severe identifiability issues Gimenez et al. 2003)
```

Fit models:

```

# phi,p
phip =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phidot,p=pdot),ou
put = FALSE,delete=T)
# phit,p
phitp =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phitime,p=pdot),ou
tput = FALSE,delete=T)
# phi,pt
phipt =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phidot,p=ptime),ou
tput = FALSE,delete=T)
# phit,pt
phitpt =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phitime,p=ptime),o
utput = FALSE,delete=T)
# phi(cov),pt
phixpt =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=PhiCov,p=ptime),ou
tput = FALSE,delete=T)
# phi(cov),p
phixp =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=PhiCov,p=pdot),out
put = FALSE,delete=T)

```

Compare models

```
collect.models()
```

```

## 5 7065.792 530.57806 0.000000e+00 7041.689
## 1 7141.081 605.86722 0.000000e+00 7135.073

```

Clearly, there is time variation in the detection process. Now, let's have a look to the estimates of the covariate regression parameters:

```
phixpt$results$beta
```

```

##           estimate      se      lcl      ucl
## Phi:(Intercept) 3.0215052 0.1266487 2.7732737 3.2697367

```

| | | | | |

| ## p:td | 0.7281680 | 0.0827991 | 0.5658817 | 0.8904542 |

The covariates are in that order: SIE.Su (x1), SIE.Au (x2), SIE.Wi (x3), SIE.Sp (x4), SOI (x5), T.Su (x6), T.au (x7), T.wi (x8) and T.sp (x9). Remember, from our preliminary exploration step above, we know that covariates 2 and 3 are highly positively correlated. However by inspecting the estimates here, these covariates seem to have an opposite effect on survival!

P2CR analysis

In this section, we show how to perform a P2CR analysis. First, we amend the design matrix we built before, and add the coordinates of the raw covariates on the principal components:

```

petrel.ddl$Phi$pc1=0
petrel.ddl$Phi$pc2=0
petrel.ddl$Phi$pc3=0
petrel.ddl$Phi$pc4=0
petrel.ddl$Phi$pc5=0
petrel.ddl$Phi$pc6=0
petrel.ddl$Phi$pc7=0
petrel.ddl$Phi$pc8=0
petrel.ddl$Phi$pc9=0
ind=1
for (i in 1974:2002){
  petrel.ddl$Phi$pc1[petrel.ddl$Phi$time==i]=pcs[ind,1]
  petrel.ddl$Phi$pc2[petrel.ddl$Phi$time==i]=pcs[ind,2]
  petrel.ddl$Phi$pc3[petrel.ddl$Phi$time==i]=pcs[ind,3]
  petrel.ddl$Phi$pc4[petrel.ddl$Phi$time==i]=pcs[ind,4]
  petrel.ddl$Phi$pc5[petrel.ddl$Phi$time==i]=pcs[ind,5]
  petrel.ddl$Phi$pc6[petrel.ddl$Phi$time==i]=pcs[ind,6]
  petrel.ddl$Phi$pc7[petrel.ddl$Phi$time==i]=pcs[ind,7]
  petrel.ddl$Phi$pc8[petrel.ddl$Phi$time==i]=pcs[ind,8]
  petrel.ddl$Phi$pc9[petrel.ddl$Phi$time==i]=pcs[ind,9]
  ind=ind+1
}

```

In the first step of the P2CR analysis, we consider each PC separately:

```

Phipc1=list(formula=~pc1)
Phipc2=list(formula=~pc2)
Phipc3=list(formula=~pc3)
Phipc4=list(formula=~pc4)
Phipc5=list(formula=~pc5)
Phipc6=list(formula=~pc6)
Phipc7=list(formula=~pc7)
Phipc8=list(formula=~pc8)
Phipc9=list(formula=~pc9)
phipc1 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc1,p=ptime),ou
tput = FALSE,delete=T)
phipc2 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc2,p=ptime),ou
tput = FALSE,delete=T)
phipc3 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc3,p=ptime),ou
tput = FALSE,delete=T)
phipc4 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc4,p=ptime),ou
tput = FALSE,delete=T)
phipc5 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc5,p=ptime),ou
tput = FALSE,delete=T)
phipc6 =

```

```

mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc6,p=ptime),ou
tput = FALSE,delete=T)
phipc7 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc7,p=ptime),ou
tput = FALSE,delete=T)
phipc8 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc8,p=ptime),ou
tput = FALSE,delete=T)
phipc9 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc9,p=ptime),ou
tput = FALSE,delete=T)

```

We now use ANODEV to test the significance of these PCs:

```

# get info on model with time-dependent survival
devtime = phipt$results$lnl
npartime = phipt$results$npar

# get info on model with constant survival
devct = phipt$results$lnl
nparct = phipt$results$npar

# test each PC:
stat = rep(NA,9)
df1 = rep(NA,9)
df2 = rep(NA,9)
for (i in 1:9){
  name = paste('phipc',i,sep='')
  devco = get(name)$results$lnl
  nparco = get(name)$results$npar
  num = (devct - devco)/(nparco-nparct)
  den = (devco - devtime)/(npartime-nparco)
  stat[i] <- num/den
  df1[i] <- nparco-nparct
  df2[i] <- npartime-nparco
}
# calculate p-value
pval = 1-pf(stat,df1,df2)
stat

## [1] 0.4561622 2.0348074 7.3439649 3.0089217 3.0594685 2.4351902 0.1359249
## [8] 0.3111156 0.7808135

df1

## [1] 1 1 1 1 1 1 1 1 1

df2

## [1] 27 27 27 27 27 27 27 27 27

pval

```

```
## [1] 0.50516673 0.16519536 0.01154679 0.09421164 0.09162907 0.13028550
## [7] 0.71524153 0.58159214 0.38469323
```

We can reject the null hypothesis that PC3 has no effect on survival.

In step 2 of the P2CR, we keep PC3 and test the significance of the other PCs:

```
Phipc1=list(formula=~pc1+pc3)
Phipc2=list(formula=~pc2+pc3)
Phipc3=list(formula=~pc4+pc3)
Phipc4=list(formula=~pc5+pc3)
Phipc5=list(formula=~pc6+pc3)
Phipc6=list(formula=~pc7+pc3)
Phipc7=list(formula=~pc8+pc3)
Phipc8=list(formula=~pc9+pc3)
phipc11 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc1,p=ptime),ou
tput = FALSE,delete=T)
phipc21 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc2,p=ptime),ou
tput = FALSE,delete=T)
phipc31 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc3,p=ptime),ou
tput = FALSE,delete=T)
phipc41 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc4,p=ptime),ou
tput = FALSE,delete=T)
phipc51 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc5,p=ptime),ou
tput = FALSE,delete=T)
phipc61 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc6,p=ptime),ou
tput = FALSE,delete=T)
phipc71 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc7,p=ptime),ou
tput = FALSE,delete=T)
phipc81 =
mark(petrel.processed,petrel.ddl,model.parameters=list(Phi=Phipc8,p=ptime),ou
tput = FALSE,delete=T)

stat = rep(NA,8)
df1 = rep(NA,8)
df2 = rep(NA,8)
for (i in 1:8){
  name = paste('phipc',3,sep='')
  devct = get(name)$results$lnl
  nparct = get(name)$results$npar
  namex = paste('phipc',paste(i,'1',sep=''),sep='')
  devco = get(namex)$results$lnl
  nparco = get(namex)$results$npar
  num = (devct - devco)/(nparco-nparct)
```

```

    den = (devco - devtime)/(npartime-nparco)
    stat[i] <- num/den
    df1[i] <- nparco-nparct
    df2[i] <- npartime-nparco
  }

pval = 1-pf(stat,df1,df2)
stat

## [1] 0.11503220 2.93526730 4.62963407 2.51795992 3.50281240 0.27595270
## [7] 0.00648602 0.72324460

df1

## [1] 1 1 1 1 1 1 1 1

df2

## [1] 26 26 26 26 26 26 26 26

pval

## [1] 0.73721042 0.09856576 0.04088822 0.12464467 0.07255703 0.60381779
## [7] 0.93642783 0.40284581

```

Now PC4 is significant according the ANODEV (remember that PC3 was removed from the list).

In step 3 of the P2CR analysis, we reiterate the process, that is we test the significance of the other PCs in presence of PC3 and PC4:

```

Phipc1=list(formula=~pc1+pc3+pc4)
Phipc2=list(formula=~pc2+pc3+pc4)
Phipc3=list(formula=~pc5+pc3+pc4)
Phipc4=list(formula=~pc6+pc3+pc4)
Phipc5=list(formula=~pc7+pc3+pc4)
Phipc6=list(formula=~pc8+pc3+pc4)
Phipc7=list(formula=~pc9+pc3+pc4)
phipc12 =
mark(petrel.processed,petrel.dd1,model.parameters=list(Phi=Phipc1,p=ptime),ou
tput = FALSE,delete=T)
phipc22 =
mark(petrel.processed,petrel.dd1,model.parameters=list(Phi=Phipc2,p=ptime),ou
tput = FALSE,delete=T)
phipc32 =
mark(petrel.processed,petrel.dd1,model.parameters=list(Phi=Phipc3,p=ptime),ou
tput = FALSE,delete=T)
phipc42 =
mark(petrel.processed,petrel.dd1,model.parameters=list(Phi=Phipc4,p=ptime),ou
tput = FALSE,delete=T)
phipc52 =

```

```
mark(petrel.processed,petrel.dd1,model.parameters=list(Phi=Phipc5,p=ptime),ou
tput = FALSE,delete=T)
hipc62 =
mark(petrel.processed,petrel.dd1,model.parameters=list(Phi=Phipc6,p=ptime),ou
tput = FALSE,delete=T)
hipc72 =
mark(petrel.processed,petrel.dd1,model.parameters=list(Phi=Phipc7,p=ptime),ou
tput = FALSE,delete=T)
```

What does the ANODEV tell us?

```
stat = rep(NA,7)
df1 = rep(NA,7)
df2 = rep(NA,7)
for (i in 1:7){
  name = paste('hipc',31,sep='')
  devct = get(name)$results$lnl
  nparct = get(name)$results$npar
  namex = paste('hipc',paste(i,'2',sep=''),sep='')
  devco = get(namex)$results$lnl
  nparco = get(namex)$results$npar
  num = (devct - devco)/(nparco-nparct)
  den = (devco - devtime)/(npartime-nparco)
  stat[i] <- num/den
  df1[i] <- nparco-nparct
  df2[i] <- npartime-nparco
}

pval = 1-pf(stat,df1,df2)
stat

## [1] 0.074403889 1.878329745 1.383425428 0.547419633 0.235267212
0.002265896
## [7] 1.282107431

df1

## [1] 1 1 1 1 1 1 1

df2

## [1] 25 25 25 25 25 25 25

pval

## [1] 0.7872699 0.1827054 0.2505976 0.4662657 0.6318687 0.9624121 0.2682514
```

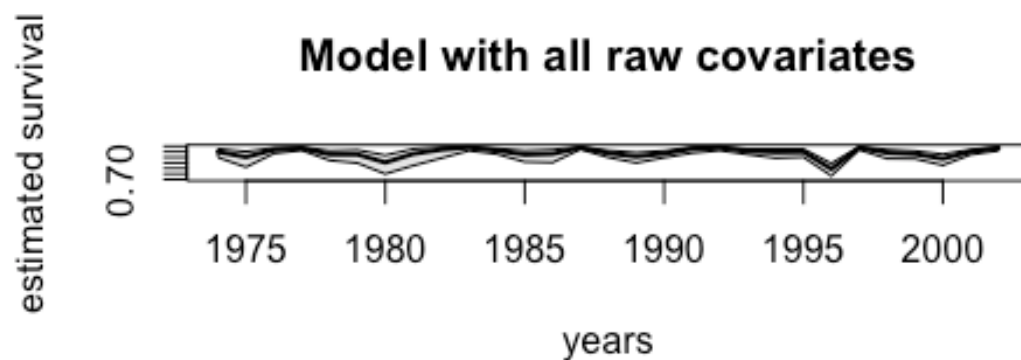

No more significant PC, the algorithm stops here.

Post-process results

We will make two plots, one with time-varying survival estimates, and another one to illustrate the relationship between survival and the selected PCs.

First, a figure displaying the time variation in survival according to a model with all raw covariates and the PC2R model:

```
#phit_mle <- phitpt$results$real[1:29,]
phicov_mle <- phixpt$results$real[1:29,]
hipca_mle <- phipc31$results$real[1:29,]
# Make a 6x6 inch image at 300dpi
#ppi <- 300
#png("time_survival_allcov.png", width=6*ppi, height=6*ppi, res=ppi)
par(mfrow=c(2,1))
plot(1974:2002,phicov_mle[,1],lwd=2,col='black',type='n',ylim=c(0.7,1),xlab='
years',ylab='estimated survival',main='Model with all raw covariates')
polygon(x=c(1974:2002, rev(1974:2002)),y=c(phicov_mle[,3],
rev(phicov_mle[,4])),col='grey90')
lines(1974:2002,phicov_mle[,1],lwd=2,col='black')
#dev.off()
#png("time_survival_p2cr.png", width=6*ppi, height=6*ppi, res=ppi)
plot(1974:2002,hipca_mle[,1],lwd=2,col='black',type='n',ylim=c(0.7,1),xlab='
years',ylab='estimated survival',main='P2CR model')
polygon(x=c(1974:2002, rev(1974:2002)),y=c(hipca_mle[,3],
rev(hipca_mle[,4])),col='grey90')
lines(1974:2002,hipca_mle[,1],lwd=2,col='black')
```

```
#dev.off()
```

Second, a figure displaying the relationship between survival and the PCs selected by the P2CR analysis.

Get the coefficient estimates for each PC and the intercept:

```
phipc31$results$beta[1:3,]
```

| | estimate | se | lcl | ucl |
|--------------------|------------|-----------|------------|------------|
| ## Phi:(Intercept) | 2.9065526 | 0.0930353 | 2.7242035 | 3.0889018 |
| ## Phi:pc4 | -0.3179565 | 0.0937602 | -0.5017265 | -0.1341865 |
| ## Phi:pc3 | 0.4987771 | 0.1117005 | 0.2798441 | 0.7177101 |

Get confidence intervals using the delta-method:

```
library(msm)
PC3 = pcs[,3]
PC4 = pcs[,4]
phi_SE3 = matrix(0, nrow = 29, ncol = 1)
estmean3 <- c(2.9065503, 0.4987728)
estvar3 <- diag(c(0.0930351, 0.1117004)^2)
phi_SE4 = matrix(0, nrow = 29, ncol = 1)
estmean4 <- c(2.9065503, -0.3179579)
```

```

estvar4 <- diag(c(0.0930351,0.0937603)^2)
for (i in 1:29){
  temp3 <- PC3[i]
  temp4 <- PC4[i]
  phi_SE3[i,] <- deltamethod(~ x1+x2*temp3, estmean3, estvar3)
  phi_SE4[i,] <- deltamethod(~ x1+x2*temp4, estmean4, estvar4)
}

ilogitphi3 <- estmean3[1] + estmean3[2] * PC3
ilogitphi3lb <- ilogitphi3 - 1.96 * as.vector(phi_SE3)
ilogitphi3ub <- ilogitphi3 + 1.96 * as.vector(phi_SE3)
phi3lb <- 1/(1+exp(-(ilogitphi3lb)))
phi3ub <- 1/(1+exp(-(ilogitphi3ub)))
phi3 <- 1/(1+exp(-(ilogitphi3)))

ilogitphi4 <- estmean4[1] + estmean4[2] * PC4
ilogitphi4lb <- ilogitphi4 - 1.96 * as.vector(phi_SE4)
ilogitphi4ub <- ilogitphi4 + 1.96 * as.vector(phi_SE4)
phi4lb <- 1/(1+exp(-(ilogitphi4lb)))
phi4ub <- 1/(1+exp(-(ilogitphi4ub)))
phi4 <- 1/(1+exp(-(ilogitphi4)))

```

Before plotting the survival as a function of the PC values, we need to find out about the raw covariates that were used to build these PCs:

```

dimdesc(res.pca, axes = c(3:4))

## $Dim.3
## $Dim.3$quanti
##      correlation      p.value
## SIE.Su    0.7413696 4.205825e-06
## T.wi     -0.5808892 9.527347e-04
##
##
## $Dim.4
## $Dim.4$quanti
##      correlation      p.value
## T.sp      0.8228262 4.300265e-08
## SIE.Su   -0.3946619 3.411627e-02

```

High (resp. low) values of PC3 mean high (resp. low) values of SIE in summer and low (resp. high) values of temperature in winter. High (resp. low) values of PC4 mean high (resp. low) values of temperature in spring and low (resp. high) values of SIE in summer.

Now we can plot the survival - PC relationships, and add the interpretation of the PCs:

```

# Make a 6x6 inch image at 300dpi
#ppi <- 300
#png("pc3_survival.png", width=6*ppi, height=6*ppi, res=ppi)
ord<-order(PC3)
plot(PC3[ord],phi3[ord],lwd=3,col='black',type='n',xlab='PC3',ylab='estimated

```

```

survival',main='',ylim=c(0.8,1))
polygon(x=c(PC3[ord], rev(PC3[ord])),y=c(phi3lb[ord],
rev(phi3ub[ord])),col='grey90')
lines(PC3[ord],phi3[ord],lwd=3,col='black')
text(-1.2,0.82,expression(' %up% 'Temp. in winter'),cex=1)
text(-1.2,0.81,expression(' %down% 'SIE in summer'),cex=1)
text(2.1,0.82,expression(' %up% 'SIE in summer'),cex=1)
text(2.1,0.81,expression(' %down% 'Temp. in winter'),cex=1)

```

```

ord<-order(PC4)
#dev.off()
#png("pc4_survival.png", width=6*ppi, height=6*ppi, res=ppi)
plot(PC4[ord],phi4[ord],lwd=3,col='black',type='n',xlab='PC4',ylab='estimated
survival',main='',ylim=c(0.8,1))
polygon(x=c(PC4[ord], rev(PC4[ord])),y=c(phi4lb[ord],
rev(phi4ub[ord])),col='grey90')
lines(PC4[ord],phi4[ord],lwd=3,col='black')
text(-1.5,0.82,expression(' %up% 'SIE in summer'),cex=1)
text(-1.5,0.81,expression(' %down% 'Temp. in spring'),cex=1)
text(1.7,0.82,expression(' %up% 'Temp. in spring'),cex=1)
text(1.7,0.81,expression(' %down% 'SIE in summer'),cex=1)

```

`#dev.off()`
